Given an list of integers called `input`, return `True` if any value appears at least twice in the array. Return `False` if every element in the input list is distinct.

For example, if the input list was `[1,3,5,7,1]`, then return `True` because the number 1 shows up twice.

However, if the input was `[1,3,5,7]` then return `False`, because every element of the list is distinct.
